GROUP 3600

“— In U.S. Pat. No. 5,426,392, noise is added to a clock signal to spread its peak spectral content. By so doing, electrical interference from this signal is spread over a larger bandwidth. This noise is then removed by filtering, thereby recovering the clock signal. While this filtering process is useful for the transmission of one harmonic component it is not useful for the transmission of information, which intrinsically has relatively broadband characteristics. The '392 patent does not use a repetitive-noise source and the information transferred is extracted by filtering rather than correlation.
